## DETAILED ACTION

### *Response to Amendment*

1. The amendment received on December 20, 2007 has been entered in full.
2. Applicant's amendments to the claims as presented in the amendment filed have been fully considered but these claims are subject to election /restriction requirements.

### *Election/Restrictions Requirements*

3. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1, 2 and 6-13 are drawn to a method for storing values of a block of pixels and it's corresponding isometrics, classified in class 375, subclass 240.24 and possibly in class 345, subclasses 555 and 565.
  - II. Claims 3-5 and 14-17 are drawn to a method and apparatus for performing a fractal image compression, classified in class 382, subclass 249.

Inventions are distinct, each from the other because of the following reasons:

Inventions II and I are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the invention II (the combination) is directed to fractal image compression which comprises storing in memory areas

the value of pixels of the range block and only three of its isometries and addressing these memory areas in read mode and invention II do not contain limitations such as “performing transformation on the block to obtain a plurality of isometries with respect to at least one axis and at least one rotation of the block” and “using only four memory areas of identical sizes in which are respectively stored an identity, and three first isometries corresponding to isometries of symmetry with respect to a vertical axis, a 270° rotation and a 90° rotation” as recited in claims 1, 2 and 6-13. The subcombination has separate utility such as invention I is directed to a method for storing values of pixels of a block and its respective or corresponding isometries.

The examiner has required restriction between combination and subcombination inventions. Where applicant elects a subcombination, and claims thereto are subsequently found allowable, any claim(s) depending from or otherwise requiring all the limitations of the allowable subcombination will be examined for patentability in accordance with 37 CFR 1.104. See MPEP § 821.04(a).

Applicant is advised that if any claim presented in a continuation or divisional application is anticipated by, or includes all the limitations of, a claim that is allowable in the present application, such claim may be subject to provisional statutory and/or nonstatutory double patenting rejections over the claims of the instant application.

Therefore, inventions I and II represent inventions that are distinct for the reasons given above and have acquired a separate status in the art as shown by their different subject matter and different classification, restriction for examination purposes as indicated is proper.
